

Solvents and Reagents for Liquid Chromatography

Solvents for HPLC, LC-MS, LC-MS/MS HLC-SOL / HLC-SOL Plus

Solvents for Preparative LC Prepsol

KANTO CHEMICAL CO., INC.

HLC-SOL

High Purity Solvents for HPLC

HLC-SOL is a solvent series which is purified by our special technology and is uniformed of chromatographic properties. Since the UV absorbance and the lot-to-lot variation are controlled and minimized, HLC-SOL improves the chromatographic reproducibility and increases detection sensitivity.

Guaranteed properties

UV Absorbance

Guaranteed absorbance at major wavelengths where the solvent itself absorbs. Absorbance at 254 nm is a guide for selecting the solvent for using the UV detector.

Relative fluorescence intensity

Guarantee amount of fluorescent impurities as relative fluorescence intensity using quinine sulfate as standard.

Refractive Index (n_D^{20})

In case of using the differential refractometer, detection sensitivity improves that the difference between sample and refractive index are huge.

Non-Volatile matter

This is an important factor when isolating target substances by preparative liquid chromatography or preparative thin-layer chromatography.

Peroxide / Acidity

This factor is important for separation analysis of the substances which easily decomposed by acids.

Water Content

The maximum value of the water content, which is the important factor to prevent column degradation and obtain a stable chromatogram, in Normal Phase Chromatography.

Stabilizer

For solvents with relatively poor chemical stability (chloroform, dichloromethane, 1,4-dioxane), add stabilizers that do not interfere with chromatography. Stabilizers are also indicated on the product label.

Solvent	Stabilizer
Chloroform	Amylene
Dichloromethane	Amylene
1,4-Dioxane	2,6-Di-tert-butyl-4-methylphenol
Tetrahydrofuran	Dibutyl hydroxytoluene(BHT)

Gradient Grade : For Acetonitrile, Distilled water

“Gradient Grade” is a baseline guaranteed solvents grade in gradient analysis. Figures 1 to 3 show the baseline fluctuation. By combining HLC-SOL acetonitrile and HLC-SOL distilled water, a stable baseline can be obtained during gradient elution.

Chromatographic Condition

Column	Mightysil RP-18GP 150-4.6 (5μm)
Temp.	Room Temp.
Flow rate	1.0 mL/min
Detection	UV210 nm
Range	0.32 AUFS

HLC-SOL

High Purity Solvents for HPLC

HLC-SOL Plus / for LC-MS Plus Series : Guaranteed Particle Amount

Acetonitrile, Methanol, Distilled water, 2-Propanol

We have achieved numerical guarantee of particles (fine particles) in solvents with "Plus -Series". It is a best choice for ultra-high-speed, high-pressure HPLC (UHPLC) systems, used stationary phase particle size of 2 μm or less with more sensitive various detectors.

①Extend column lifetime

[Reduction of the risk of raising back pressure]

③Reduction of running cost

[Reduction of the frequency of consumable parts under low pressure operation]

②Improvement of stability and reproducibility

[Improvement of detection sensitivity]

HLC-SOL

High Purity Solvents for HPLC (for Pharmaceutical Analysis)

We offer the best solvents for pharmaceutical QA / R&D analysis meeting the requirements of Reag.JP, Reag.USP and Reag.Ph Eur. These solvents can be used for pharmaceutical analysis globally. In addition, the warranty period is displayed on the label, which is useful for QC process.

- Meeting the requirements of Reag.JP, Reag.USP and Reag.Ph Eur.
- Expiry (YY / MM / DD) is indicated on the label.
- Test date (YY / MM / DD) is indicated on COA.

Solvents for LC/MS

The feature of LC/MS analysis is that the target ion can be analyzed without being affected by background noise. On the other hand, there is a case the impurities derived from the eluent and reagent interfere with the ionization efficiency and quantification of the target substance. We offer "LC/MS" series solvent as a new grade that is more suitable for advanced LC/MS or LC/MS/MS analysis. We also offer products that contribute to improving the reliability and workability of LC / MS analysis, such as high-purity formic acid packed in ampoules, or acetonitrile mixed with formic acid.

Features:

- Metal cap
- Specially treated bottle with low metal elution
- Suitability Test for LC/MS
- Guaranteed Metal impurity
- Guaranteed particle amount

Comparison with conventional LC Solvents ① Baseline fluctuation in gradient

Impurities derived from the eluent cause baseline fluctuations and impurity peaks, affect the LC / MS analysis results. The following figure shows the UV detection result in the low wavelength (210 nm) which is sensitive to impurities, and the baseline fluctuation due to MS (TIC, ionization condition is the instrument default). In the case of an analysis of the purpose of quantifying the minimum amount in the single ion mode, the amount of impurities detectable by TIC may disturb the detection. This indicates that there is a limit in the conventional HPLC solvent quality assurance.

Acetonitrile

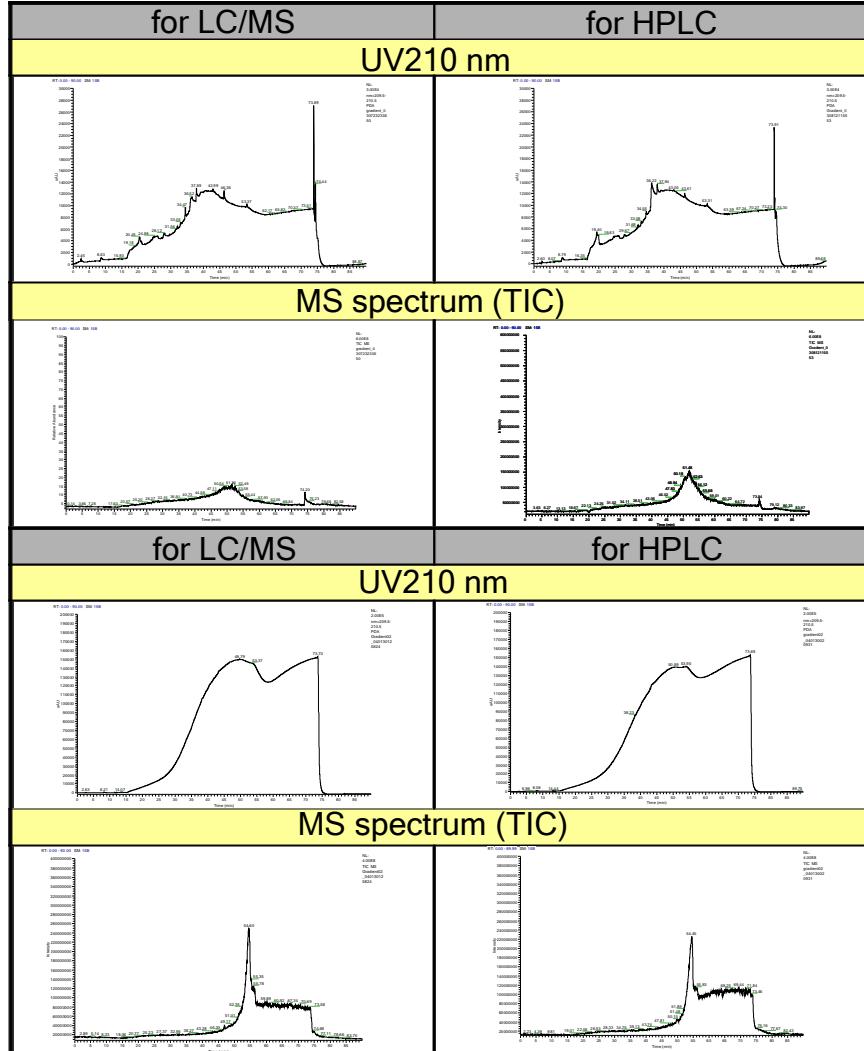

Chromatographic Condition

Column	Mightysil RP-18 GP 150-2 (5μm)	
Temp.	40 °C.

Solvents for LC/MS

The solvent quality can be confirmed by direct infusion into MS. "LC / MS grade" solvents have achieved high purity by optimizing treatment of bottles or our manufacturing process. In addition, we manage impurities for each lot by this method, and you can use with peace of mind for LC/MS analysis, always and everywhere.

Comparison with conventional solvents ② Base line of MS Infusion

Acetonitrile

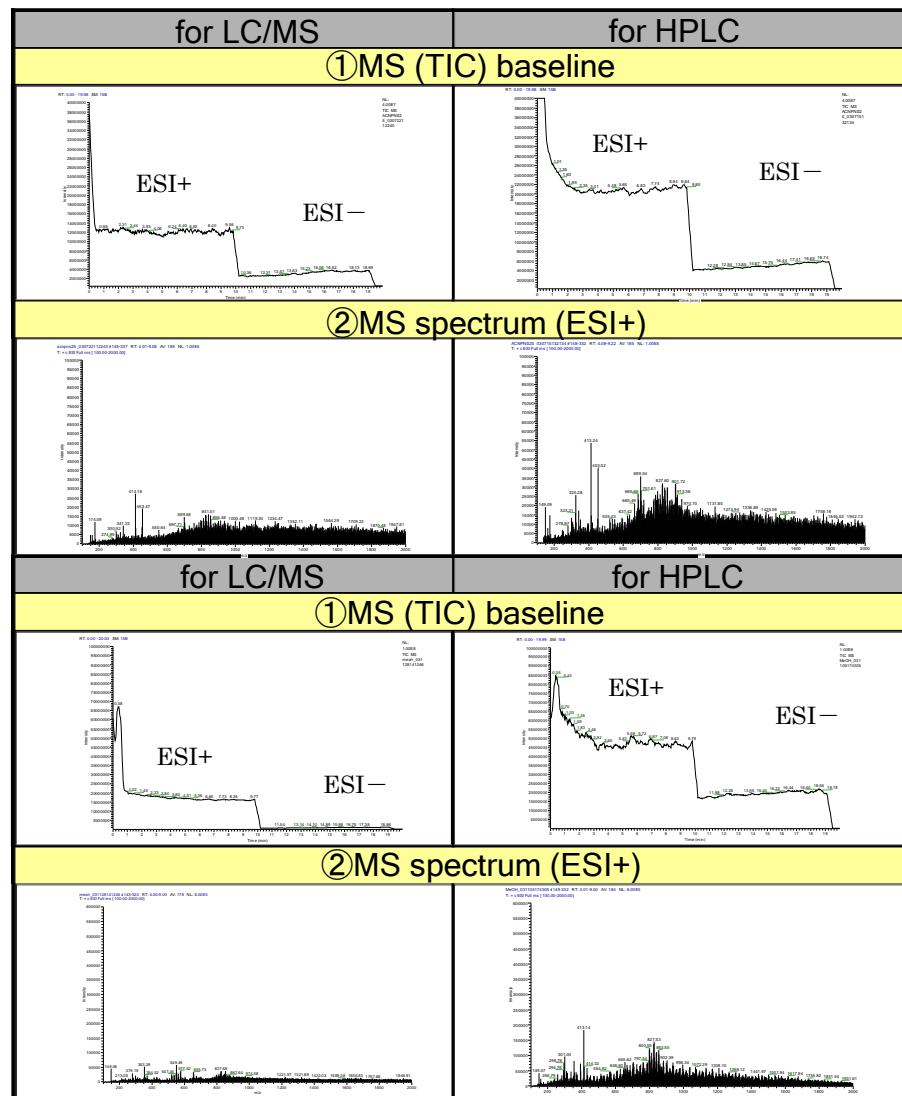

MS infusion result

① :

Basline of direct infusion each solvent into MS (TIC, ESI+/- mode).

② :

Accumulated MS spectrum averaged for 5 minutes (ESI+ mode).

Methanol

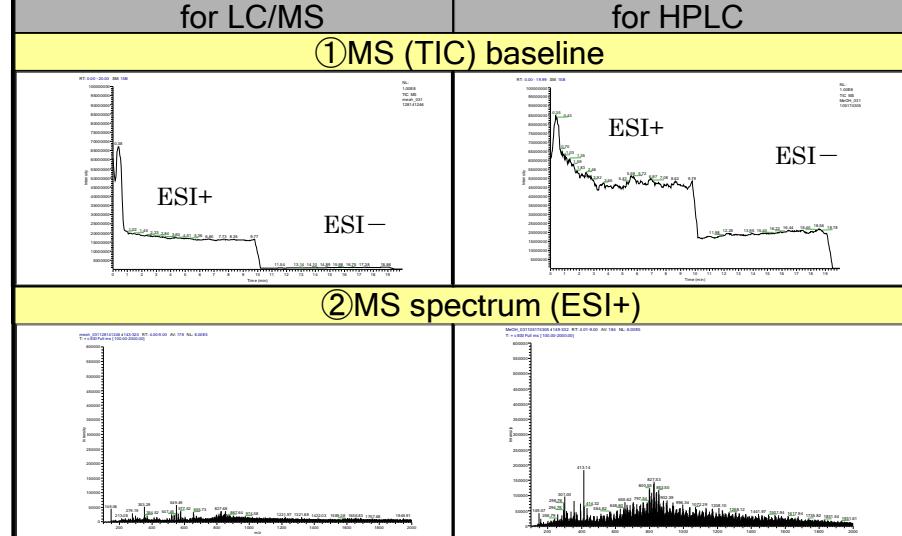

MS infusion result

① :

Basline of direct infusion each solvent into MS (TIC, ESI+/- mode).

② :

Accumulated MS spectrum averaged for 5 minutes (ESI+ mode).

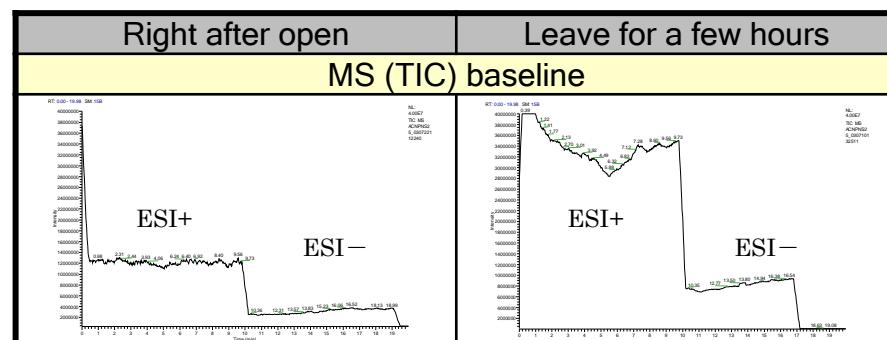

Column : Contamination from analysis environment

After solvent is opened, if it leave as it is, causes contamination from environment circumstances. This contaminant will be observed as an increase in the MS baseline. We recommend to use LC/MS solvents immediately after opening, to maintain it's high purity.

Methanol

MS infusion result

Basline of direct infusion each solvent into MS (TIC, ESI+/- mode).

Prepsol

Solvents for Preparative Chromatography

Preparative work with HPLC is an effective method of separating and purifying medicinal ingredients or biopharmaceuticals. It also has a potential for common industrial application. Solvents used for this procedure must be of high quality as well as inexpensive. To meet such requirements, we offer solvents for mass-preparative liquid chromatography. Prepsol has the advantageous features of low UV absorption and limited nonvolatile substances. We provide Prepsol in 18-liter packaging for large-scale application.

Guaranteed properties

Non-volatile matter

Special treated solvent to minimize impurity.

UV Absorbance

Presol yields low blank in UV absorption.

Peroxides • Acidity

For separation of unstable substance against acids or peroxides solvent with Low content of acidity or peroxide is important.

Refractive Index (n_D^{20})

In use with RI detector, the larger the refractive index difference between sample ingredients and the solvent, the more the detection sensitivity is enhanced.

Water content

Water content is the important factor to prevent column degradation and obtain a stable chromatogram, in case of Normal Phase Chromatography.
