

# Explosive Standards Reference Guide

AccuStandard®

Explosive standards are traditionally used for the remediation of soil and water in locations where explosives have been stored. These same standards are being used to calibrate baggage screening detectors at airports and other secure locations (embassies and other government buildings). They also are used by police departments, government agencies (i.e. TSA, Homeland Security) and the military in K-9 odor recognition training for explosives. Recent advances in analytical instrumentation have demonstrated detection in the part per trillion range.<sup>1</sup>

AccuStandard has working relationships with both government and private sector K-9 training facilities and laboratories that provide valuable information and insight into the latest developments in explosives.

To assist in all aspects of explosive detection and analysis, we synthesize an array of explosives as well as metabolites, degradation products, and raw materials. AccuStandard is the only U.S. commercial source for TATP, HMTD, and HNS.

In addition to catalog items we offer special formulations for EPA method and customer-specific applications.

Bomb detection dogs are imprinted and trained to detect various types of explosives using pharmaceutical-type tins. Holes are drilled into the top of the tin to provide an odor cone for each explosive. The dog is repeatedly subjected to each odor and is rewarded when it properly alerts to it. Through this positive reinforcement process, the dog "learns" the odors associated with each explosive.
